a Drug-specific gene-hit spectra

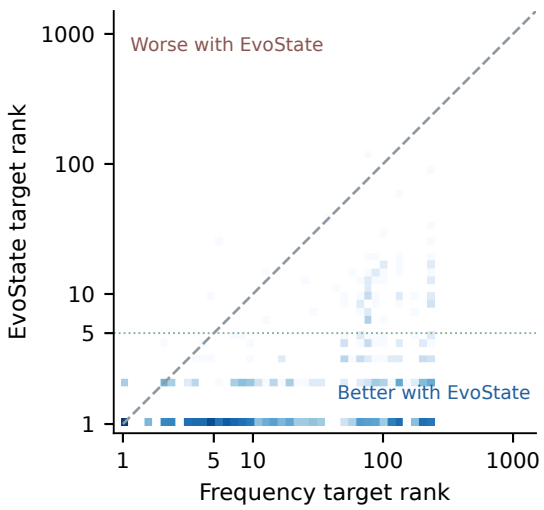

Top 100 shown; diversity uses all detected genes.
Raw gene-level hits; no co-occurrence merging.

b MEC | 97 endpoint replicates, 32 backgrounds

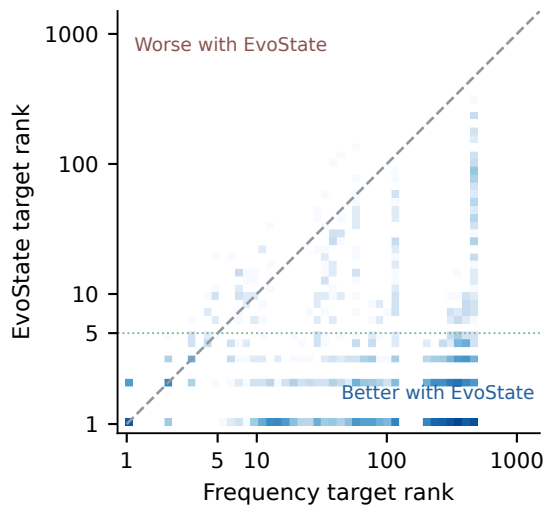

c NIT | 1,819 inferred transitions

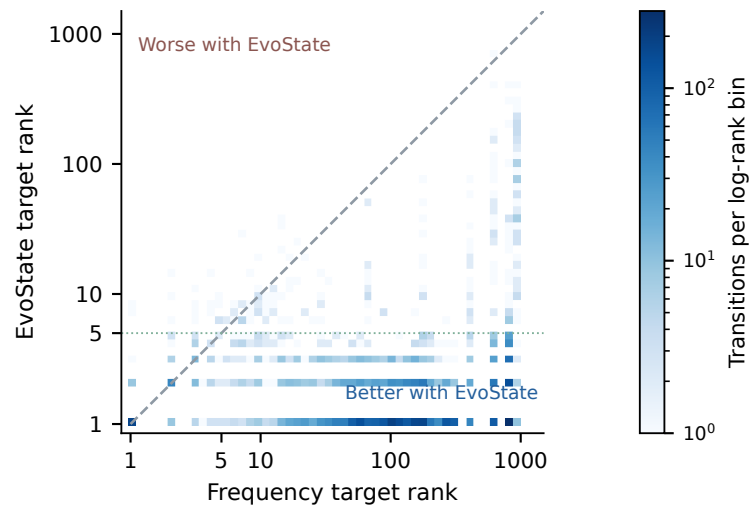

Population-equal: 56.5% improve / 1.8% worsen
Top-5: 52.4% → 84.5%
Transition-weighted improvement: 87.1%

d MEC | 2,258 inferred transitions

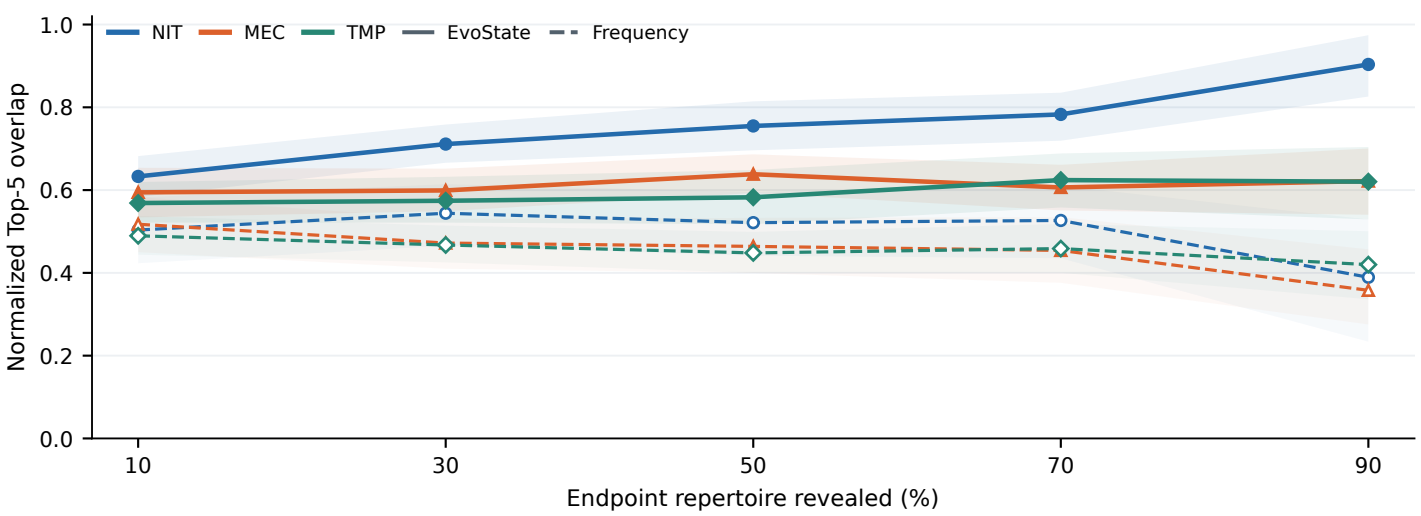

Population-equal: 58.0% improve / 13.3% worsen
Top-5: 37.5% → 62.2%
Transition-weighted improvement: 88.2%

e TMP | 4,154 inferred transitions

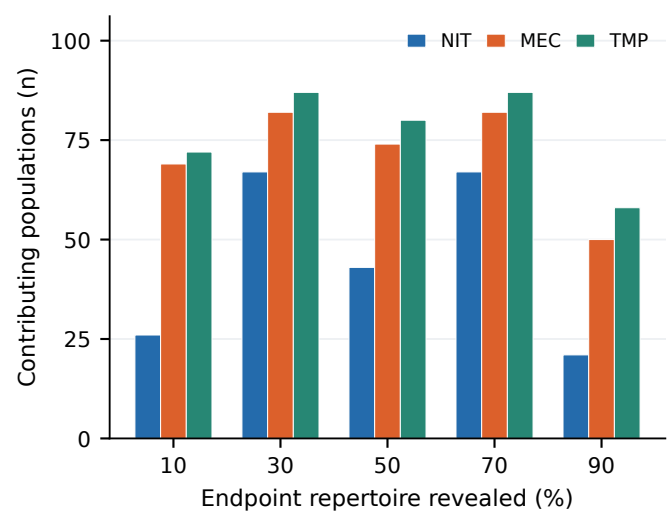

Population-equal: 64.5% improve / 6.8% worsen
Top-5: 37.4% → 70.7%
Transition-weighted improvement: 92.6%

f Remaining-gene prioritisation after random reveal

Population coverage by reveal bin

Coverage varies across bins; populations may overlap.

a–b: sequenced endpoint subset. c–e: inferred targets; density is transition-weighted, headline statistics are population-equal.

f: cached random-reveal predictions, reaggregated without treating repeated permutations as independent populations. Historical CV is tabulated separately.
