Historical evaluation | E. coli inferred-state transition prediction

Reported aggregate metrics, reproduced without refitting — NOT certified strict unseen-background validation

Drug	L	Transitions	Groups	Method	Mean logL	Top-1	Top-3	Top-5	MRR	AUC

Large original groups may be split across folds; partial rerun audit found original-group overlap. This does not identify every historical split.

L includes background features, not only candidate genes. Historical Prevalence and the full-data endpoint-frequency reference in Figure 6 have different fitting contexts.
